ITEM	DESCRIPTION	MATERIAL / SPECIFICATIONS
1	MOTOR	IE 1,2,3 / 3 PHASE / 4 POLES / 415V/50hz
2	DRIVE SYSTEM	RIGHT ANGLE / HELICAL TYPE / V-BELT AND PULLEY
3	FAN BLADE	FRP / CAST ALUMINUM ALLOY
4	FAN STACK	FRP
5	FAN HUB	CAST ALUMINUM ALLOY
6	MAIN FRAME STRUCTURE	HOT DIPPED GALVANIZED STEEL
7	DISTRIBUTION PACK	PVC
8	INLET LOUVER	PVC
9	HIGH PERFORMANT FILM FILL PACK	PVC
10	FILL SUPPORT	HOT DIPPED GALVANIZED STEEL
11	ACCESS DOOR	FRP
12	SLOPE COLD WATER BASIN	FRP
13	COLD WATER BASIN SUMP	FRP
14	INTERNAL WALKWAY	HOT DIPPED GALVANIZED STEEL
15	LADDER	HOT DIPPED GALVANIZED STEEL
16	CASING PANEL	FRP
17	GEAR REDUCER SYSTEM	OPTIONAL

## Tower Construction

Tower casing body is made out of F.R.P. (Fiberglass Reinforced Plastics) which is corrosion free, very durable and yet light. Furthermore the body is coated with a special epoxy consist of anti-ultraviolet agent making the tower body more resistant to UV sunlight. The tower main structure frame is using steel which has undergo hot dipped galvanization (HDG) process to prevent rust.

## Cold Water Basin

The cold water basin is constructed from F.R.P. (Fiberglass Reinforced Plastics) which is corrosion free and is supported by HDG steel frame underneath. The cold water basin is also slopping basin to ensure the dirt and sediments trapped inside the basin is being diverted towards the depressed sump in the centre of basin.

The depressed sump will prevent air lock from occurring during the tower operation. The sump is also supplied with suction strainer, makeup water ball valve, overflow and drain connection.

## Mechanical drive system

Fans are of axial type designed to deliver air performance at low noise level. Fan blades material shall be FRP as standard and aluminium alloy as optional. . All fan blades are factory balanced before shipped out. The fan is operating inside a fan stack enclosure to streamline the air entry while maintaining maximum fan efficiency.

The V belt drive system which connects the cast iron pulleys at the motor and fan is contained inside FRP belt cover. This is to ensure that the belts are protected from moist discharge air. Optional aluminium alloy pulleys are available.

The motor is of TEFC weather proof squirrel cage for 3 phase 415 V / 50 Hz power supply.

The motor shall be located outside the discharge air stream below the belt cover to prolong the motor life and ease of maintenance and access.

The fan bearing has a lubrication delivery system from external point outside the fan stack to the fan bearing to allow grease top up to be carried even when the fan is in operation.

## Fills

The film type cellular fill is made of air vacuum forming Ultra Violet (UV) Light resistant PVC sheets which have corrugated surface. The surface has been specially designed to spread the water droplet from hot water basin evenly.

The infill shall be installed in glued blocks and ease of removable for cleaning. The second layer of infill blocks shall be supported with galvanized pipes to prevent the weight being imposed on the bottom layer.

## Water distribution system

The hot water basin is open gravity type flow made from FRP material that is resistant to Ultra Violet (UV) Light and corrosion. The water is distributed via specially positioned holes in the basin onto a scattering bars below. These scattering bars will sprinkle the water effective and evenly on the fill section underneath.

## Access Door

Each tower should be provided with as access door to enter the internal compartment of cooling tower for inspection and maintenance. The access door shall be of FRP material and able to be locked.

## 1. Evaporating Loss (E) kg/h

The evaporating quantity may be calculated by the equation below:

$$E = \frac{Q}{600} = \frac{(T1-T2)}{600} \times WF \times C$$

Where WE	:	Evaporating Quantity	kg/h
Q	:	Heat of Cooling	Kcal/h
600	:	Latent Heat of Water	Kcal/kg °C
T1	:	Intake Water Temperature	°C
T2	:	Discharge water Temperature	°C
WF	:	Circulating Water Flow	kg/h
C	:	Specific Heat of Water	1 Kcal/kg °C

## 2. Drift Loss ( D ) kg/h

The drift loss (D) depend on the type of cooling tower and drift eliminators used. Due to the air flow at a certain speed created by the fan, some water droplets are carried away with the air, this is called carry-over loss.

There are many factors affecting the figure and this generally at a low level, approximately 0.005% of the normal circulating water quantity.

## 3. Blowdown Quantity (B) kg/h

The blow-down (B) can be carried out in any of the following methods

- (1) The drain valve is kept slightly open during the run.
- (2) Maintain the operating water level higher to create slight overflow
- (3) The whole basin water is replenished with fresh water during shut down for cleaning

The required level of blowdown varies depending on the water quantity or the extent of concentrations, but is generally believed to be about 0.2% to 0.4 % for air conditioning applications.

## 4. Replenishing Water Flow rate (R) kg/h

$$R = E + D + B$$

Eg: Evaporation loss : E = 0.98%  
 Drift loss : D = 0.005%  
 Blow-down : B = 0.4%

Therefore, the make-up water required is approximately  
 = 0.98% + 0.005% + 0.4%  
 = 1.385%

Hence, considering safety margin, a make up of 2% of the circulating water flow rate is sufficient.

# RECOMMENDED COOLING TOWER ARRANGEMENT

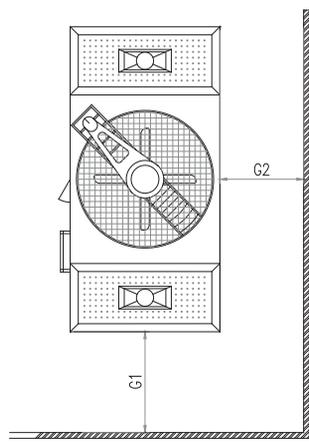

FIGURE : 1

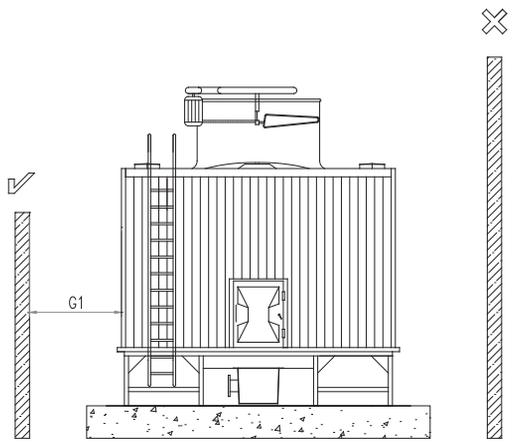

FIGURE : 2

Refer Table 1, for the distance recommended if cooling tower is located near to a wall.

Tower Size	Recommended Distance (mm)	
	G1 (Air Intake)	G2 (For Maintenance Access)
100 - 250	1500	1000
280 - 450	1800	1000
500 - 950	2400	1000
1000 - 1500	3000	1000

Table 1: Distance Cooling Tower to Wall

Based on Figure 2, the wall near to the cooling tower is always recommended to be lower than cooling tower. This is to prevent discharge air from cooling tower to recirculate, as this will effect the cooling tower's performance.

It is always preferred, if the wall is a louvered wall, that there should be a 70% net free area and the louver height should not be higher than cooling tower.

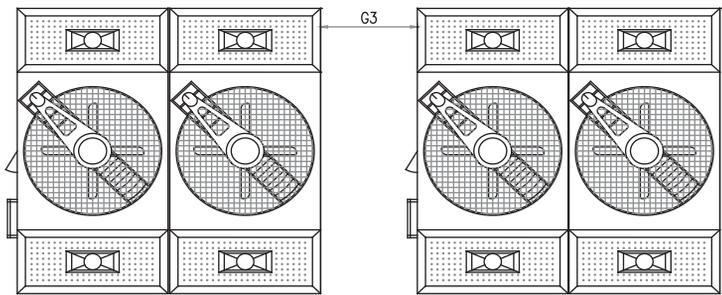

FIGURE 3

Tower Size	Recommended Distance (mm)
	G3
All Models	1000

Table 2: Distance Cooling in Series Arrangement

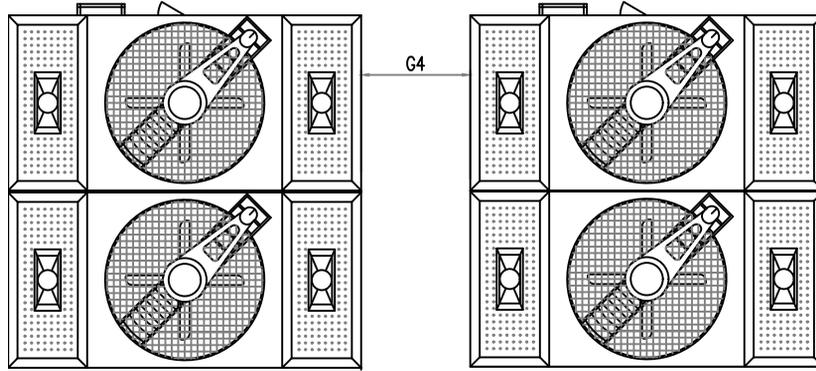

FIGURE 4

Tower Size	Recommended Distance (mm)	
	G4	
100 - 450	3000

SOLID WALL

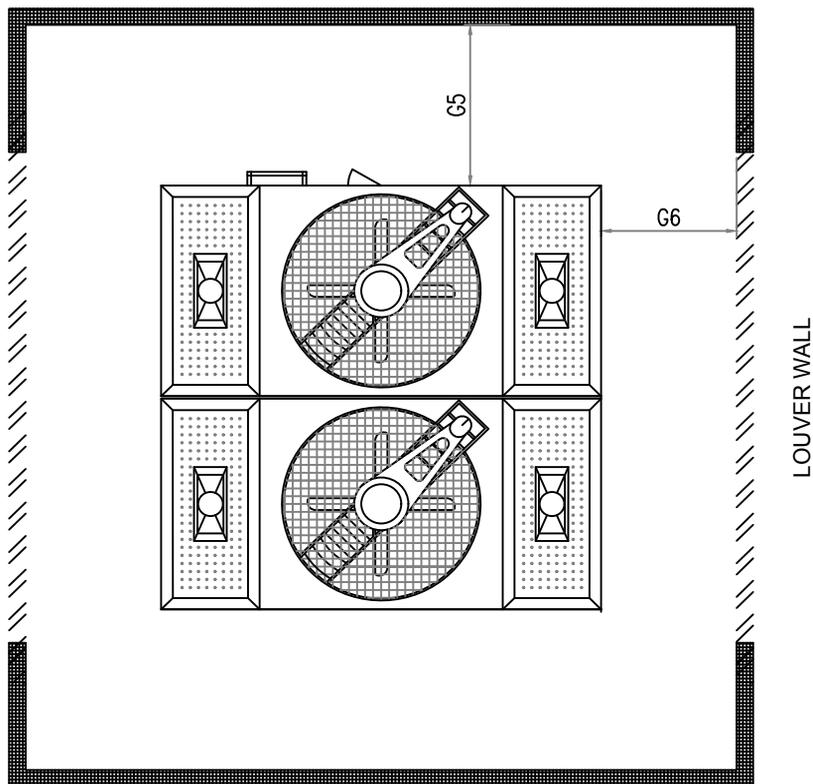

FIGURE 5

Tower Size	Recommended Distance (mm)	
	G5 (Panels Side)	G6 (Louvers Side)
100 - 450	1000	1500
500 - 950	1000	2000
1000 - 1500	1000	2500

Table 4 : Distance Cooling between Solid Wall & Louver Wall

## GEAR REDUCER

In addition to using V belt, right angle reduction gears are used for stringer application that requires no down time due to wear and tear. This type of option gives the building owner the convenience of planning the down time for planned maintenance. Design features and ratings are in accordance with the minimum requirements of AGMA (American Gear Manufacturers Association) and CTI (Cooling Technology Institute) standards.

## HANDRAIL

The safety option is to ensure that working at elevated height of cooling tower is now complete with guard rail around the tower parameters. This option can be further enhanced with caged ladder which is an added feature as well.

## HIGH EFFICIENCY MOTOR

Our high efficiency motor are rated to Eff2 or IE1 (standard) , EFf1 and IE2 (high efficiency). We also offer latest IE3 (premium) standards as indicated by IEC 60034-30. The choice of efficiency is up the client's preferences. For usage with variable speed inverters, we recommend special modification to the motor is required in order to allow the motor to operate at low frequency.

## DISCHARGE HOOD

This option gives alternative diversion of hot air discharge from the fan stack to other direction deem more suitable. It is made from Fibreglass Reinforced Polyester (FRP) which is the same material as the fan stack. The most popular discharge angle is 45°.
